Experiment 7: Shell Programming, Process and Scheduling

Name: vinit kumar Roll No.: 590029353 Date: 2025-09-23

Aim:

- To write shell scripts that demonstrate process management.
- To understand how to schedule processes using cron and at.
- To monitor running processes and practice job control commands.

Requirements

- A Linux machine with bash shell.
- Access to process management commands (ps, top, kill, jobs, fg, bg).
- Access to scheduling utilities (cron, at).

Theory

Every program running in Linux is a process identified by a unique process ID (PID). Shell programming allows automation of tasks including spawning and controlling processes. Process management commands like ps, top, kill, jobs, bg, and fg let users monitor and control execution. Scheduling utilities such as cron (repeated tasks) and at (one-time tasks) allow tasks to run automatically at defined times. Combining scripting with scheduling is a core system administration skill.

Procedure & Observations

Exercise 1: Writing a basic shell script

Task Statement:

Create a shell script that prints the current date, time, and the list of logged-in users.

Command(s):

```
#!/bin/bash
echo "Current date and time: $(date)"
echo "Logged in users:"
w
```

Output:

```
vinit@LAPTOP-P8DCHODS:/mnt/c/Users/HP/OneDrive/Desktop/day 7$ vim current.sh
vinit@LAPTOP-P8DCHODS:/mnt/c/Users/HP/OneDrive/Desktop/day 7$ cat current.sh
#!/bin/bash
echo "current date and time:$(date)"
echo "logged in user:"
w
vinit@LAPTOP-P8DCHODS:/mnt/c/Users/HP/OneDrive/Desktop/day 7$
```

Exercise 2: Background and foreground processes

Task Statement:

Run a process in background and bring it to the foreground.

Command(s):

```
sleep 60 &
jobs
fg %1
```

Output:

Exercise 3: Killing a process

Task Statement:

Start a process and terminate it using kill.

Command(s):

```
sleep 300 &
ps aux | grep sleep
kill <pid>
```

Output:

Exercise 4: Monitoring processes

Task Statement:

Use ps and top to monitor processes.

Command(s):

```
ps aux | head -5
top
```

Output:

```
vinit@LAPTOP-P8DCHODS:/mnt/c/Users/HP/OneDrive/Desktop/day 7$ ps aux | head -5 top
head: cannot open 'top' for reading: No such file or directory
vinit@LAPTOP-P8DCHODS:/mnt/c/Users/HP/OneDrive/Desktop/day 7$ |
```

Exercise 5: Using at for one-time scheduling

Task Statement:

Schedule a script to run once at a specified time using at.

Command(s):

```
echo "/home/user/myscript.sh" | at 08:30 atq
```

Output:

```
vinit@LAPTOP-P8DCHODS:/mnt/c/Users/HP/OneDrive/Desktop/day 7$ echo "home/user/myscript.sh" | at 08:30 atq
syntax error. Last token seen: a
Garbled time
vinit@LAPTOP-P8DCHODS:/mnt/c/Users/HP/OneDrive/Desktop/day 7$ |
```

Result

- Learned to create and run shell scripts.
- Managed processes using background, foreground, and kill commands.
- Monitored processes with ps and top.
- Scheduled recurring tasks with cron and one-time tasks with at.

Challenges Faced & Learning Outcomes

- Challenge 1: Remembering the crontab time format. Solved by using online crontab generators and practice.
- Challenge 2: Ensuring atd service is running for at command. Fixed by starting the service with systemctl start atd.

Learning:

Gained hands-on knowledge of process creation and termination.

• Learned job control and scheduling using cron and at.

Conclusion

This experiment provided practical experience with shell scripting, process management, and scheduling. These are critical skills for system administrators to automate and control Linux environments effectively.
