Experiment 8: Shell Programming (Continued)

Name: vinit kumar Roll No.: 590029353 Date: 2025-09-23

Aim:

- To extend shell programming concepts by using conditional statements, advanced scripting constructs, and command-line arguments.
- To practice writing scripts that perform decision-making and parameter handling.

Requirements

- A Linux system with bash shell.
- Text editor and permission to create/execute shell scripts.

Theory

Conditional execution in shell scripts allows branching logic using if, elif, else, and case statements. Scripts can accept command-line arguments using \$1, \$2, ... and \$@ for all arguments. Control flow constructs combined with user input and arguments allow dynamic and reusable scripts.

Procedure & Observations

Exercise 1: Using if-else

Task Statement:

Write a script to check whether a given number is positive, negative, or zero.

Explanation:

We used an if-elif-else construct to compare the number against 0.

Command(s):

```
#!/bin/bash
num=$1
if [ $num -gt 0 ]; then
   echo "$num is positive"
elif [ $num -lt 0 ]; then
   echo "$num is negative"
else
   echo "$num is zero"
fi
```

Output:

Exercise 2: Using case

Task Statement:

Write a script that takes a character as input and classifies it as vowel, consonant, digit, or special character.

Explanation:

The case statement provides pattern matching for multiple options.

Command(s):

```
#!/bin/bash
ch=$1
case $ch in
  [aeiouAEIOU]) echo "$ch is a vowel" ;;
  [bcdfghjklmnpqrstvwxyzBCDFGHJKLMNPQRSTVWXYZ]) echo "$ch is a consonant" ;;
  [0-9]) echo "$ch is a digit" ;;
  *) echo "$ch is a special character" ;;
esac
```

Output:

Exercise 3: Command-line arguments

Task Statement:

Write a script that accepts filename(s) as arguments and prints the number of lines in each file.

Explanation:

Command-line arguments are accessed using \$@. Looping through each argument allows file-wise operations.

Command(s):

```
#!/bin/bash
for file in "$@"; do
  if [ -f "$file" ]; then
    echo "$file: $(wc -l < "$file") lines"
  else
    echo "$file not found"
  fi
done</pre>
```

Output:

Exercise 4: Nested conditionals

Task Statement:

Write a script to check if a year is a leap year.

Explanation:

A leap year is divisible by 4, but if divisible by 100 it must also be divisible by 400.

Command(s):

```
#!/bin/bash
year=$1
if (( year % 400 == 0 )); then
   echo "$year is a leap year"
elif (( year % 100 == 0 )); then
   echo "$year is not a leap year"
elif (( year % 4 == 0 )); then
```

```
echo "$year is a leap year"
else
echo "$year is not a leap year"
fi
```

Output:

Result

- Implemented conditional statements (if-else, case) in shell scripts.
- Practiced handling command-line arguments and nested conditions.
- Wrote reusable and flexible shell scripts.

Challenges Faced & Learning Outcomes

- Challenge 1: Forgetting to quote variables in conditions resolved by using "\$var" to avoid word splitting.
- Challenge 2: Pattern matching in case practiced with multiple examples.

Learning:

- Learned practical use of branching and decision-making in shell scripting.
- Understood command-line argument handling for automation.

Conclusion

This experiment extended shell programming by introducing decision-making and parameter handling. The scripts demonstrate the flexibility of shell programming for different use cases.
